

Project Design Phase

Proposed Solution Template

Date	26 June 2026
Team ID	SWTID-2026-8141
Project Name	Heart Disease Analysis and Visualization Dashboard
Maximum Marks	2 Marks

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1	Problem Statement (Problem to be Solved)	Heart disease information — including patient risk factors, diagnosis outcomes, hospital infrastructure, and treatment cost — is scattered across multiple sources. This makes it difficult for clinicians, researchers, and patients to compare risk factors, assess hospital capacity, and make informed decisions. The project aims to solve this by providing a centralized visualization platform with interactive dashboards and analytics.
2	Idea / Solution Description	An interactive Heart Disease Analytics platform that integrates clinical, regional, hospital, and cost datasets using MySQL and SQL, visualized through Tableau dashboards and stories, and delivered via a Flask web application.
3	Novelty / Uniqueness	Combines clinical risk-factor data with hospital infrastructure and treatment cost data in a single interactive platform, rather than isolated, single-purpose tools.
4	Social Impact / Value Proposition	Helps clinicians identify high-risk patients faster, helps hospital administrators plan cardiac care resources, and helps patients understand risk and treatment cost — supporting preventive care and reducing delayed diagnosis.
5	Business Model (Revenue Model)	Can be extended as a subscription analytics tool for hospitals/clinics, or offered as an open educational resource for public health research institutions.
6	Scalability of the Solution	Additional datasets (wearable ECG data, new hospitals, new regions) and new dashboards can be added without changing the core architecture.
