

Project Performance Test

Model / Dashboard Performance Testing

Date	5 July 2026
Team ID	SWTID-2026-8141
Project Name	Heart Disease Analysis and Visualization Dashboard
Maximum Marks	4 Marks

Model / Dashboard Performance Testing:

S.No	Parameter	Values / Description
1	Data Rendered	Successfully rendered 4 CSV datasets containing patient clinical records, regional case data, cardiac hospital information, and treatment cost/risk category data.
2	Data Preprocessing	Removed duplicate records, handled missing values, standardized column names, corrected inconsistent data formats, and created calculated fields (age group, risk score).
3	Utilization of Filters	Interactive filters were implemented for Age Group, Gender, Chest Pain Type, Risk Level, and Region to enable dynamic exploration of dashboard insights.
4	Calculated Fields Used	Created calculated fields for Diagnosis Rate, Risk Score, Age Group, Average Cholesterol, KPI Analysis, and Interactive Dashboard Visualizations.
5	Dashboard Design	Developed 1 Interactive Tableau Dashboard containing 8 visualizations including Hospital Map, Regional Hospital Analysis, Diagnosis Distribution, Heart Rate Analysis, Treatment Cost Comparison, Risk Factor Ranking, Chest Pain Analysis, and Diagnosis Treemap.
6	Story Design	Developed 1 Tableau Story consisting of 5 story points that explain cardiac hospital infrastructure, regional case distribution, patient risk factors, treatment cost, and top risk indicators.
7	Publishing & Web Integration	The completed Tableau dashboard and story were published successfully using Tableau Public. The embed code was integrated into the Flask web application, allowing users to access interactive heart disease analytics through a web interface.
8	Responsiveness	The web page responsiveness and dashboard loading performance were successfully verified across desktop and mobile viewports.

Testing Result:

The Heart Disease Analytics Platform successfully passed functional and performance testing. The system processes patient, hospital, and cost datasets accurately and renders all dashboard visualizations and filters as expected.
